

Technical Data

# Solid Colour Breakdown (RGB for Screens & CMYK for Print)

## RGB Values

RGB values represent colours using the RGB colour model, where colours are created by combining varying intensities of red (R), green (G), and blue (B) light.

Each of the three primary colour channels is assigned a value between 0 and 255.

## CMYK Values

CMYK values represent colours using the Cyan (C), Magenta (M), Yellow (Y), and Key/Black (K) colour model. This model is primarily used for printing, where colours are created by layering ink.

CMYK values are expressed as percentages.

## Important Note on Colour Consistency

The appearance of colours may vary across different devices and outputs due to differences in display technologies, calibration settings, colour profiles, and printing processes.

As a result:

- RGB colours may appear differently on various screens
- CMYK prints may not perfectly match on-screen colours

The use of our current samples gives the colour and finish that a customer would expect to receive, the following breakdowns should only be used as an indication of actual product colour.
